ABSTRACT

The Association of Southeast Asian Nations (ASEAN) includes 10 Nations in Southeast Asia. Its population is approximately 600 million people with combined nominal gross domestic production (GDP) had grown to more than US\$ 2.3 trillion, almost equal with eighth largest economy in the world. Many strong economies worldwide suffered from the global financial crisis (GFC) in 2008 which resulted dipping in global CO₂ emission. This study surveyed the consumption trend of petrol, coal, and natural gas as main carbon emissions in all 10 countries from 2002 to 2012. Economic growth and its effect on CO₂ emission were illustrated. Although the effect of global financial economy varies in the different selected economies, the trend of CO₂ emission was not dependent on GDP changes. In contrast to global emission, the 2008 GFC and the decrease in GDP did not result in the reduction of CO₂ emission among ASEAN members.

Keywords: CO₂ Emission, Major Asian Countries, Gross Domestic Production, Global Financial Crisis

JEL Classifications: F64, G01, Q4

1. INTRODUCTION

The global financial crisis (GFC) of 2008 was the worst economic crisis worldwide (Pendery, 2009) that affected many economies since the great depression of the 1930s. The decline rate in gross domestic production (GDP) was 9.8% in the Europe, 14.4% in Germany, and 7.4% in UK (Rizga, 2009). The close relationship between GDP and CO₂ emission is attributed to the changes in CO₂ by fluctuation in the economic growth (Soytas and Sari, 2009). Declining world economy resulted in the dip in CO₂ level (Pincock, 2010), although the decrease was much smaller than the experts' expectation. In 2012, the nature climate change announced the rapid growth in CO₂ emissions after the 2008-2009 global financial crises (Peters et al., 2012). However, all research and data reported a decrease in the global CO₂ emission through GFC (Atlas, 2012).

This paper included 10 Association of Southeast Asian Nations (ASEAN) members located in Southeast Asia. These countries are included almost 600 million populations and \$2.3 trillion GDP.

The ASEAN is a combination of different economies with a variety of sources, industries, and governmental policies. Singapore

and Brunei are the two highest income countries (per capita) worldwide, but Myanmar people have less than US \$5 daily income. (Appendix I indicates collected data of selected countries and their share in the total world amount).

The 2008 GFC was the second financial crisis after 1997 in Asia and presented different effects. Accordingly, the development trend in some Asian countries stopped because of the crisis, but in some other countries, the effect was very small or short term (Chhibber et al., 2009). As shown in Figure 1, the economic growth of the selected countries had been decreasing since 2007 or 2008, with the highest reduction in 2009.

As shown in Figure 1, some economies, such as Myanmar, showed a decreasing trend in growth that started in 2007 and continued until the end of 2008. The intensive decreasing trend in Myanmar began in the 1st months of 2008. The GDP trend for Lao was almost stable through these years. A (Growth, 2013) This trend indicates that the GFC did not affect the economies of these countries because of different reasons, and the crisis effect reached Indonesia with a year delay.

Accordingly, this study calculated and compared the trend of CO₂ emission from 2006 to 2012 and analyzed this trend in junction

with the economic growth trend in the same period for all the selected countries. This study focused on the three main fossil energy consumptions, namely, natural gas, petroleum, and coal. The trend started in 2006, which was the stable year of countries before the GFC. The year 2008 was the crisis peak, 2010 was simultaneous with unfolding signs of crisis recovery, and 2012 showed an almost stable global economy. The results indicate that the changes in total CO₂ emission in the study periods were not related to the economic growth Southeast Asia.

2. FOSSIL ENERGY CONSUMPTION IN SELECTED COUNTRIES

Majority of Southeast Asian countries need to import fossil energies to fulfil their country needs. Among these 10 countries Malaysia and Thailand are importer of coal with an increasing trend (Figure 2) (Pettinger, 2012).

Both Thailand and Malaysia importing more than 20 million metric ton coal, right now. In 2011 the trend of importing coal for Thailand was increasing aggressively but for Malaysia it was reducing. The other ASEAN members don't have coal import. Four countries in Southeast Asia are able to product coal. As Figure 3 shows, Vietnam has most production of coal in the region.

Vietnam in 2012 produced more than 40 million metric ton carbon when Malaysia produced <5 million metric ton. Myanmar (Burma) and Thailand coal production was around 1 million ton (Geoba, 2013). Accordingly, most export in area has done by Vietnam. This country had more than 15 million metric ton coal export to its neighbours (Figure 4).

Malaysia and Thailand burned most of their coal production in the country and their export is only around 1 million ton.

In petroleum group, Thailand is largest importer in the region. Only in 2012 Thailand imported 48 million metric ton crude petroleum. This amount for Vietnam is not clear but for Malaysia is 11 million metric ton (Figure 5).

Although Indonesia is one of the crude petroleum importers in the area, the amount of imports is <1 million metric ton. Meanwhile the production of crude petroleum among Southeast Asian countries shows that Malaysia is biggest producer of petroleum. As is shown in Figure 6, after Malaysia Vietnam and Brunei and Thailand are producing crude petroleum.

Figure 6 confirms that in a 10 years period, trend of production petroleum in Malaysia, Brunei and Vietnam had been reducer but for Thailand this trend shows a slow increase. Figure 7 shows that 4 from 10 ASEAN countries are exporting crude petroleum. Malaysia has exported more than 12 million metric ton crude petroleum in 2012. This amount for Vietnam was 9, Brunei 7 and Thailand 3 million metric ton (Figure 7).

As Figure 7 indicates Brunei and Thailand had a smooth trend in their export but Malaysia and Vietnam's petroleum export had been fluctuated.

Figure 1: Gross domestic production (GDP) amount from 2002 to 2012 for Southeast Asian countries (GDP, 2014) (GDP trend for Myanmar is not available)

Figure 2: Coal import by Southeast Asian countries (metric ton)

Figure 3: Trend of coal production among Association of Southeast Asian Nations members (metric ton)

Figure 4: Trend of coal export among Southeast Asian countries (metric ton)

Brunei is the only exporter of Natural gas in Southeast Asia. As well as Brunei, Malaysia is producing natural gas but all Malaysian

natural gas burns inside the country. It seems Singapore is the major gas importer in this area.

Figure 8 Shows trend of CO₂ emission in the area based on purchasing power parity (PPP). Singapore is producing minimum CO₂ among these countries and Vietnam maximum CO₂. Also Brunei CO₂ emission from 2006 to 2008 has increased intensively.

Since 2000 the trend of emitting CO₂ in most of the Southeast Asian countries has a decreasing trend except Vietnam trend. Also CO₂ emission of Brunei despite of decreasing trend until 2006 has a jump in 2007 and 2008.

3. CO₂ EMISSION AND GDP TREND IN SELECTED COUNTRIES

The effect of GFC on countries' GDP is clear (Berg et al., 2011). Based on this finding, the countries' GDP shows (Abreu et al., 2011) the effect of financial crisis on the countries' growth (Lin, 2008). The effect of GDP on the countries' CO₂ emission resulted from coal, petroleum, and natural gas (Table 1). Table 1 shows the calculated CO₂ emission for any GDP between 2006 and 2012 for the selected countries. Appendix I shows the calculation process.

Figure 9 shows the Southeast countries' growth conditions with CO₂ emission. The carbon emission data were clear until 2011.

Figure 9 illustrates an increasing trend of CO₂ emission in seven countries, namely, Afghanistan, Bangladesh, Mongolia, Malaysia, South Korea, India, and China, without any halt despite all changes in countries' GDP (Table 2).

Table 2 indicates the CO₂ emission grew constantly in the aforementioned economies, in contrast to the fluctuating CO₂ emission in other countries. The GDP trend in the selected countries showed the two main categories for Major Asian Countries (MAC). In the first category, GDP was affected by GFC, and the second category belonged to other countries' GDP without any effect from GFC. The CO₂ emission of the 24 selected countries showed two different situations. CO₂ emission indicated a dependency to GDP in the first condition but not in the second situation. The effect of GDP on GFC in some countries, such as South Korea or Malaysia, showed a small decrease in emission speed, but this slower emission did not result in the decrease in total emission, such as GDP. Despite the change in acceleration of emission in South Korea or Malaysia, the CO₂ emission trend was still increasing. A glance on the economic condition mentioned in Figure 9 showed that only Bangladesh, Afghanistan, and Nepal in the MAC were not affected by the global recession. Also the CO₂ emission trend of the seven countries, namely, Japan, Brunei, Vietnam, Sri Lanka, the Philippines, and India, showed a direct dependence on GDP trend and GFC.

4. CONCLUSION

The GFC of 2008 was the worst economic crisis worldwide that affected many economies since the Great Depression of the 1930s. Except Laos, all Southeast Asian countries show a declining trend in

Figure 5: Trend of crude petroleum import among Southeast Asian countries (metric ton)

Figure 7: Trend of crude petroleum export among Southeast Asian countries (metric ton)

Figure 8: Trend of carbon dioxide emission in Southeast Asia (kg per PPP \$ of gross domestic production)

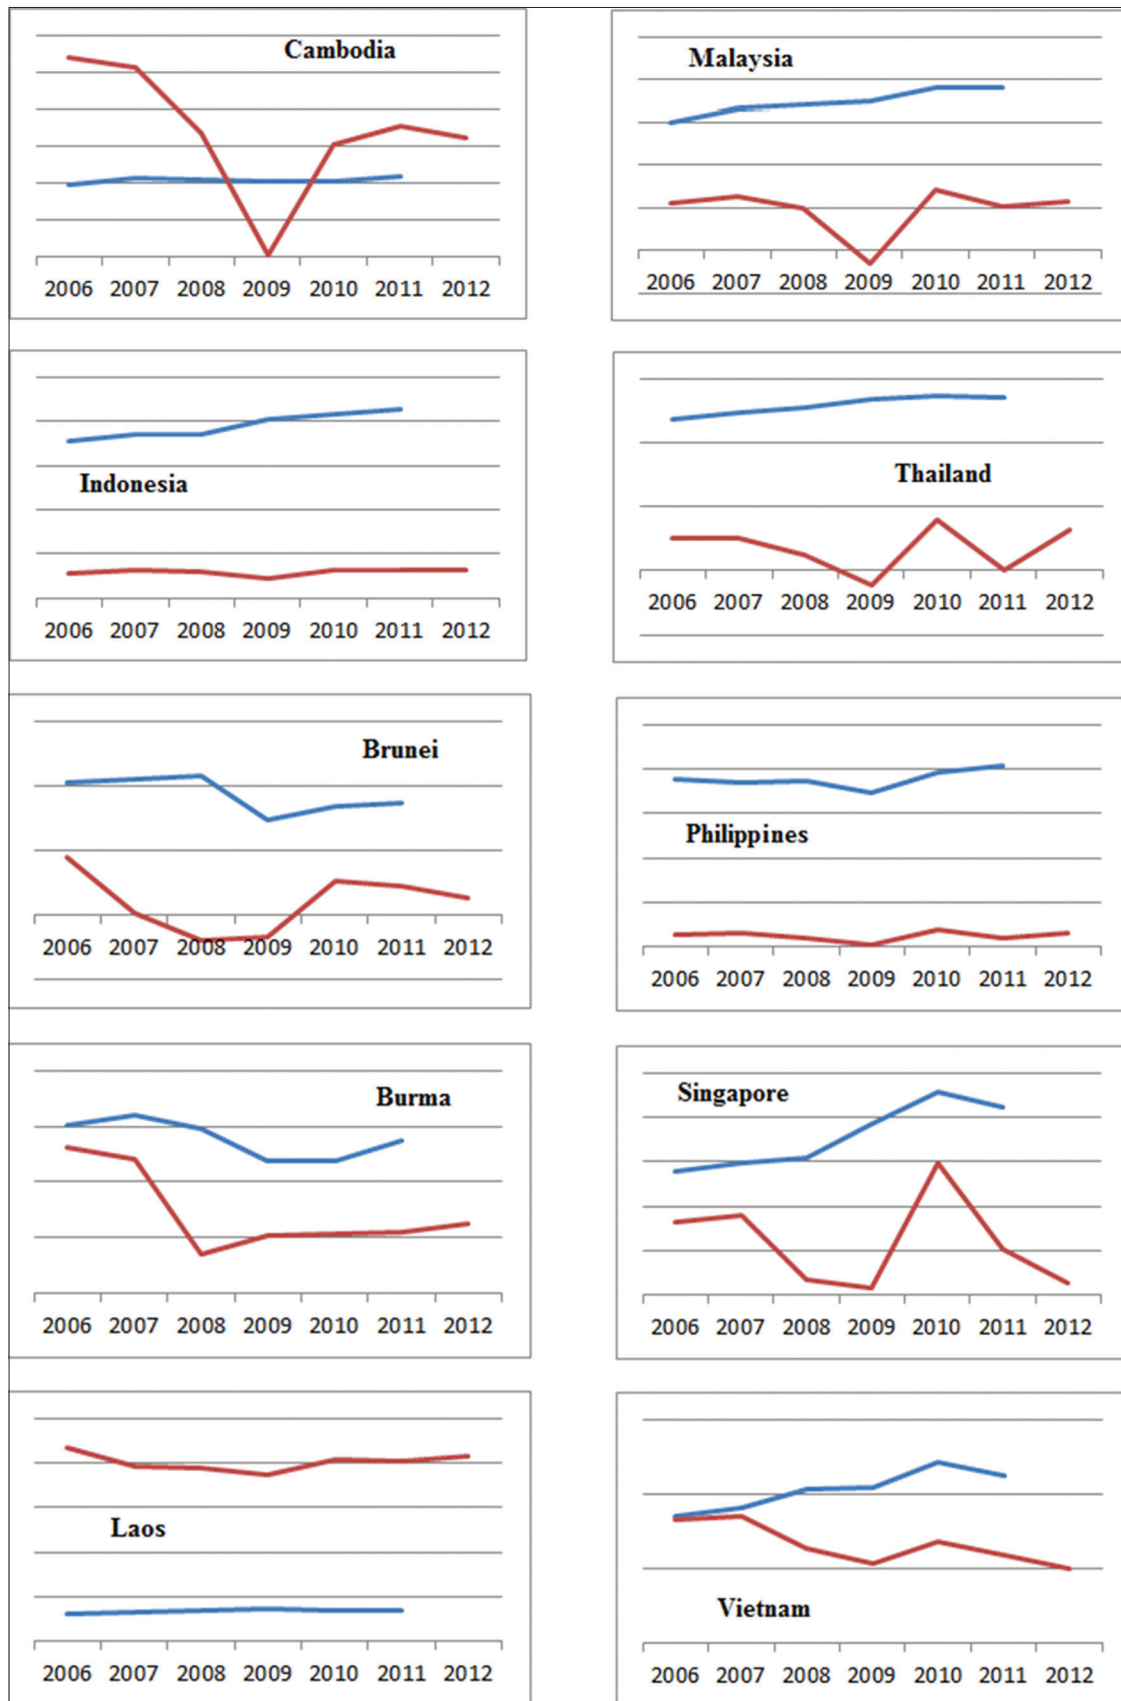

Figure 9: Relationship between gross domestic production growth and carbon dioxide emission in Southeast Asia from 2006 to 2012

GDP growth rate since 2006 or 2007 which is on lowest point in 2009. Nevertheless, GDP per capita, PPP (constant 2005 international \$) shows a stability for most of the countries' region except Singapore

and Brunei. Malaysia increased the production and import of coal; Vietnam increased coal production and decreased exporting coal to the other countries. Thailand also increased the production of coal.

Table 1: Total CO₂ emission and percentage of GDP in MAC from 2006 to 2012 (data were extracted from the World Bank database)

Country	2006		2007		2008		2009		2010		2011		2012	
	CO ₂ emission	GDP	CO ₂ emission	GDP	CO ₂ emission	GDP	CO ₂ emission	GDP	CO ₂ emission	GDP	CO ₂ emission	GDP	CO ₂ emission	GDP

GDP: Gross domestic production, MAC: Major Asian Countries

Table 2: Effect on selected countries by the GFC

Country	GDP affected by GFC	CO ₂ emission affected by GDP
Brunei	Yes	Yes
Burma (Myanmar)	Yes	Yes
Cambodia	Yes	No
Indonesia	Yes	No
Laos	Yes	No
Malaysia	Yes	No
Philippines	Yes	Yes
Singapore	Yes	No
Thailand	Yes	No
Vietnam	Yes	Yes

GFC: Global financial crisis, GDP: Gross domestic production

Countries tried to have to fix their petroleum imports. Malaysia, Brunei and Vietnam decreased in their petroleum production but Thailand slightly increased in its production. But all four countries decreased in their petroleum exports. Brunei is the only exporter of Natural gas in Southeast Asia. As well as Brunei, Malaysia is producing natural gas but all Malaysian natural gas burns inside the country where Singapore is the major gas importer in this area.

The close relationship between GDP and CO₂ emission is attributed to the changes in CO₂ by fluctuation in the economic growth. Accordingly, observation on GDP growth and CO₂ emission in these countries splits countries to two different groups. First group including Cambodia, Malaysia, Thailand and Singapore don't show any meaningful relationship but the second group including Indonesia, Brunei, The Philippines, Burma, Laos and Vietnam show a strong relationship between GDP and CO₂ emission. Most probably this attitude is related to the countries energy consumption. The survey on energy production and consumption confirms GFC was effective on growth rate of the countries in Southeast Asia in a short time but countries with replacing energy sources tried to continue their growth trend.
